Abstract:

The aim of the research is to highlight the aspects and advantages of using the method of indoor classroom learning, which is traditionally used in the educational process.

Index Terms: classroom, inside classroom learning, knowledge, approach, learning process, teacher’s guide, like-minded students.

The classroom is the place where teachers actively create the conditions for learning weaving together knowledge of the discipline or field of knowledge; ways of working in that discipline or field; their knowledge of how to make the various concepts, content and procedures in that discipline or field learnable.¹

The inside learning is a learning process that is typical of the traditional teaching method and is learning with a sense of classroom environment and responsibility. For example, the equipment and devices available in the classroom, posters, teaching aids, the location of the teacher and the teacher, the decoration of the classroom with equipment in the prescribed requirements, etc. are all processes reminiscent of the classroom. Inside classroom learning is the acquisition of knowledge using classroom and classroom-based subjects, based on textbooks, artificial templates, visual aids, handouts, and sometimes the subject and dictionary being studied. The imaginary worlds of students are used in the framework.

The classroom environment allows students to interact face-to-face with their peers and teachers. This is an additional social benefit and educational assistance. Because students see the same peers in each session, they will have the opportunity to build friendships. In higher education, students can find lifelong professional connections. On the educational side, students will have the opportunity to physically participate in a lecture or class discussion. If students do not understand something, they can always ask the teacher for an explanation.

In some cases, the classroom environment is the only learning style that students are aware of and therefore the most conducive environment for them to learn. In the classroom, students will have the opportunity for practical, structured learning. Textbooks, written lectures, and self-management activities provide distance learning. Many students rely on this structure to support their studies, and the transition to an online learning experience can make it difficult for them to retain material.

Campus-based learning experience means that the lesson schedule is predetermined and unchangeable. Students should form their personal schedules around the school, not in any other way. If plans change unexpectedly or an emergency occurs, the student will not be able to change the course schedule to submit the work at another time. If there is a conflict in planning between work and school, students will be forced to choose between tuition or interests.

Benefits of Inside Classroom Learning

¹ <https://www.google.com/search?q=inside+classroom+learning&rlz=>

<p>The Teacher Can Read The Students</p>	<p>A teacher can better interpret the student's body language and tone of voice when they're in the same room together. A child asked to read and work on workbooks alone without any assistance; nobody would observe the struggles faced by the student on a problem. A child flipping through slides in an online presentation isn't getting any feedback at all until they fail the online quiz. Thus, the teachers play a significant role. Teachers who are present and conscientious can engage with children as they start to struggle so they don't waste time trying to figure out something subsequently they don't give up on the subject altogether. However, this requires having a teacher who cares about the kids instead of sticking with the lesson plan and has the time and resources to work with children individually.</p>
<p>The Social Interaction Can Keep Kids Engaged</p>	<p>Classroom interaction with other students can keep kids engaged. This can improve information retention above what they'd remember if they just sat in a lecture. One way this happens is during the question answer sessions when other kids respond to the teachers' questions and the teacher provides feedback and corrections. A child reluctant to answer due to erratophobia may also pick up on the enthusiasm that others have for the subject, making them more interested. Group lessons and activities emphasize the contents taught in class which thus benefits in building the child's overall social skills.</p>
<p>They Learn How to Deal with Gaps in Their Knowledge</p>	<p>In a classroom environment, your child is one of ten to forty students supervised by the teacher. This can moderate their ego. It also makes it safe to make mistakes, because everyone missed a few questions on the test or gave a wrong answer in the class discussion. They learn to ask the teacher or others what the right answer is and they learn how to deal with the temporary disappointment of being wrong. That is better for their long-term self-esteem than making them think that they're never wrong because minimizing mistakes or hiding them outright leads kids to blame others for their own failings.</p>
<p>Coaches Organizational Skills</p>	<p>When a child is homeschooled or tutored, they are typically the center of attention, that is, they are the ones catered to. They may receive a workbook or online lecture, and that's it, they have the full leverage and independence regarding breaks as they'd like. Whereas, classes follow a set schedule and while children may receive assistance once in a while, they have to take responsibility for themselves. They need to bring books and other supplies to school. They have to show up on time and deal with work in a specific time allotted. And</p>

		<p>failure to do these things leads to consequences. It is essential for children to learn these lessons early in life, because your child won't be able to function in a workplace when they think they can arrive whenever they like and refuse tasks until they're in the mood. And they might fail at work if they can't get their act together.</p>

Table 1. Advantages of inside classroom learning

Hence, the Classroom which is the standard way of educating children is always beneficial for longer term. Classroom learning can be modified with new & simple technology which is available widely in the market today. This helps keeping the traditional classroom environment intact while topping it up with some modern ways of learning.

Teacher's guide

Many of your questions on English are so specific that the information given by the teacher during the classroom process was based on the vabilims. It is often clear that clear explanations of complex grammar and vocabulary will be more effective if they are given in a dynamic and relevant manner. Here the teacher comes as a crucial guide for English language development. The teacher is a walking, talking resource bank that can not only answer all students 'questions and concerns, but is also gentle to improve yourself in aspects of the language that you may find boring (e.g. grammar and vovabulary) motivates.

English-only environment

After entering the English class, students assimilate themselves into this language along with the room environment and leave the mother tongue behind for a long time. It is a very powerful and motivating learning tool that cannot be replicated by accessing a mobile app or YouTube channel at home. As an English-only environment, the classroom forces you to develop all the important skills - speaking, reading, writing and listening - to strengthen your understanding of the language.

Like-minded students

If a student does not choose to take a private, one-on-one lesson with a teacher, joining the class will allow him or her to interact with peers who have a common goal, i.e. to practice their English language skills and strengthens. This helps classmates increase motivation through the student's overall experience, providing a confident person who can ask ideas and questions both in and out of the classroom.

Discipline

Doing English independently seems like any difficult and time-consuming task that needs to be done, and even when more distractions appear in the learning process, the mind can be disturbed. Learning in the classroom provides a sense of discipline, as the student in the classroom has no choice but to focus on learning English for the next hour or two.

In conclusion, the inside classroom method and all the technologies used in it are traditionally applied approaches, and the applications used in it are carried out within the framework of the topic. An English learner can feel the English environment in an in-classroom learning approach and accept topics within the classroom. In general, the advantages and benefits of indoor classroom learning are many.
