PHILOSOPHICAL CHARACTERISTICS OF INFORMATION SECURITY AND ANALYSIS OF HUMAN PROBLEMS IN THE 21ST CENTURY

Biyimbetov Jaksilik Kilishbaevich
Karakalpak State University named after Berdak

Resume
This article philosophically analyzes the problems of information security and influence on human consciousness. In this, he mainly interpreted the content of various information affecting the human mind from a socio-philosophical point of view.

Keywords: man, society, state, security, psychological impact, problem, politics, economy, culture, civilization.

Today, in an era when the countries of the world are rapidly developing, the problem of security has become one of the most important and necessary problems for all countries. Therefore, in modern science, security[1] is considered as a philosophical phenomenon. Every country pays strong attention to the issue of security in the way of its development. Today, ensuring the security of the state and society is carried out not only in military spheres, but also in information spheres. The Republic of Uzbekistan especially shows the importance of these exercises. The relevance of this for our country is clearly seen in the strengthening of national impartiality and the development of the economy and market relations, deepening of social reforms.

That's why I'm learning these exercises about the appearance and structure of information - ensuring information security, the characteristics of open information systems, the psychological struggle of individuals, society and the state, information tools for victory, communication, radiation, monopolization, psychological destruction, campaigning in society. It will be necessary to manage society, manage people and treat others with special respect.

With the help of these concepts and terms taken from the theories of psychology, sociology, and philosophy, it helps to understand the content and methods of victory information tools, and therefore, to distinguish useful ideas from unpopular ideas.

It is possible to set aside public opinion and achieve a certain goal. It should be said that the concept of manipulation is relative, because any influence on public opinion can be evaluated as biased. It should be mentioned that it is far from the only possibility nowadays.

The information security of the society consists of the possibility of damage to its spiritual, political branches, cultural abilities, people who organize people's social order, information infrastructures and the information provided with their help.

The subject of information security of the state is the impossibility of harming the state's business in the management of public works built from information and public information infrastructures.

Prioritization of national maps in the information branch means a set of conditions that create a risk of damage to the objects of national maps in the information branch and in the implementation of the maps.

That is, in the branch of information business, there is a priority of harming a person's and public's legal reputation, information, information infrastructure, as well as business related to the implementation of national maps related to these objects.

In the section of information, data of priority to business and society means the restriction of the right of individuals and the public to have open information, to use the right to conduct business activities that are not regulated by the law.[2] And these are considered to be information that provides spiritual and mental treatment of personal safety. In addition, the front of the individual "virtual information" is considered the most dangerous priority for the human population due to the fact that it can mold the use of technologies to influence the spiritual business.

The information system is considered one of the priority data for the society in the information branch, which is the provision of important infrastructure for communication points, social life.

Today, there are no informational-psychological struggles (interpersonal struggles) that include the following topics in their intellectual qualities:

- politics;
- diplomatic;
- financial and economic;
- military.

In the context of the globalization of the world information space, the strategic task facing the states that have fallen into the object of foreign information threats oriented towards clear goals is to strengthen and clearly protect the state's national values (especially economic values) on the information front and, in this way, protect them from interference (political, diplomatic, economic and (from other means) widely and intelligently use.

To ensure security in information networks:

- protect the state region from information-psychology priorities and people;
- it is necessary to manage the information itself, the national information system, and protect the information in the economy, banking, military and other systems from external information thieves to a sufficient extent and firmly.

The main methods of ensuring security in the information field are: legal, technical and economic methods.

The requirements and obligations of the authorities in the process of ensuring information security:

- monitor the possibilities of their services, activities;
- compliance with all procedures established during information storage;
- believe in oneself, one's own strength and capabilities;
- alertness;
- create your own system in the process of collecting and analyzing information
- national maps of vital importance
- a deeply understood and enlightened section of the authorities connected with ensuring the self-preservation of the nation as a cultural-historical unit, the protection of national capabilities, social and state institutions, the impartiality of the state, and the stable development of people, society and the state.

In the international information space, there is still no consensus among officials, politicians, and practitioners regarding the concept of information security and issues of information security. However, many believers consider the need to solve this problem as soon as possible:
- Around different saints;
- In the degree of state policy;
- Around international and regional deserts.

In other words, due to the use of information psychology and communication technologies for geopolitical purposes, which have been developing year by year, certain information (for example, information aimed at changing the system of cultural and spiritual abilities of the people) in the "relevant" social area for a long time in the direction of actions aimed at the "bridge type" tour. There are strong threats to the life service of the society and the state.
