Aimed at Improving the Entrepreneurial Literacy of Young People and Women and Ensuring
Self-Employment"

This article describes the issues of supporting young people and women in our country and the system of distance learning.

In the current information age, when digital technologies occupy an important place in all sectors of any country, it is important to pay attention to digital knowledge and information technologies for the more sustainable development and progress of society. Because in many countries of the world, especially developed and highly developing countries, the digital economy is growing at a much faster pace.

More than half of the population of Uzbekistan are young people under 30 years old; today's youth are the creators of our tomorrow, our future; entrepreneurship, which is the basis of the market economy, by its nature, requires risk-taking, mobility, entrepreneurial qualities, most of which are embodied in young people; the level of productivity of human labor is higher compared to his creative ability, i.e., the period of youth.

In the conditions of today's globalization, it is important to direct young people to entrepreneurship, including by providing them with work and supporting their aspirations for entrepreneurship, preventing them from falling under the influence of various foreign ideas. In this sense, it is worth noting that one of the main tasks today is to widely involve graduates of vocational colleges, especially young people, in entrepreneurship, and to ensure the participation of deeply educated, highly educated, independent thinking young people in economic and social changes in our country.

Today, people's perfect mastery of not one but several sciences and fields is becoming a need of the hour. The need to acquire several specialties is increasing in the conditions of globalization, in which current fields and sciences are closely connected with each other. Meeting such needs through the form of distance education is an important direction of adapting the education system of our country to world standards.

For young people and women, the Pedagogical Innovation Institute has developed a scientific and innovative project "Creating a single electronic database (online web portal) aimed at improving the entrepreneurial literacy of young people and women and ensuring self-employment". released The purpose of this project is to create a single electronic database

(online web portal) aimed at improving the entrepreneurial literacy of young people and women and ensuring self-employment.

On the electronic platform, the directions of improving entrepreneurship and financial literacy of young people and women and ensuring self-employment were divided into two directions. The first course is an online course on entrepreneurship and business, and the second course is dedicated to self-employment [1].

The first direction of the web portal was based on the knowledge and practical skills necessary to start an entrepreneurial activity in determining the content and hours of the educational modules in the entrepreneurship and business online course, and this short-term training program was designed for 60 hours, information was prepared on the topics of the training program, and each module videos were created and its methodical support was developed. The prepared video and information on methodical support were placed on the electronic platform <https://biznestadbir.uz>.

The second line of the web portal is self-employment, aimed at earning income through self-employment of young men and women, and short-term vocational training courses have been organized.

Methodological support for short-term training courses in the direction of self-employment was developed and placed on the <https://biznestadbir.uz> electronic platform. Participants who successfully complete the short-term training course will receive an electronic certificate through an online web portal.

The electronic educational resource is convenient in many ways and helps to increase the level of information technology competence of young people and women in the process of education, to use unusual methods and tools of teaching, and to form entrepreneurial competence. Also, as a result of the use of electronic educational resources, the information space of young people and women will expand, and it will lead to self-development and improvement.

This requires attracting young men and women to the fields of entrepreneurship and opening a wide way for them to engage in entrepreneurial activities, to make full use of their existing opportunities, to conduct entrepreneurial activities based on high efficiency, initiative and organization, and to raise them to be perfect people in all respects at the level of world requirements [2].

Therefore, the organization of the educational process in the form of distance education - the open and convenient use of various sources of information and communication by the teacher and students, the expansion of the content of education focused on specific professional activities, the development of independent learning skills in students, age, qualifications, health, working conditions, depend on the location.
